

eIDAS 2 ir  
EU Digital Identity Wallet

-Lietuvos galimybės

Audrius Ramoška  
[soverio.com](https://soverio.com)

## Where are these “Lietuvos galimybės”?

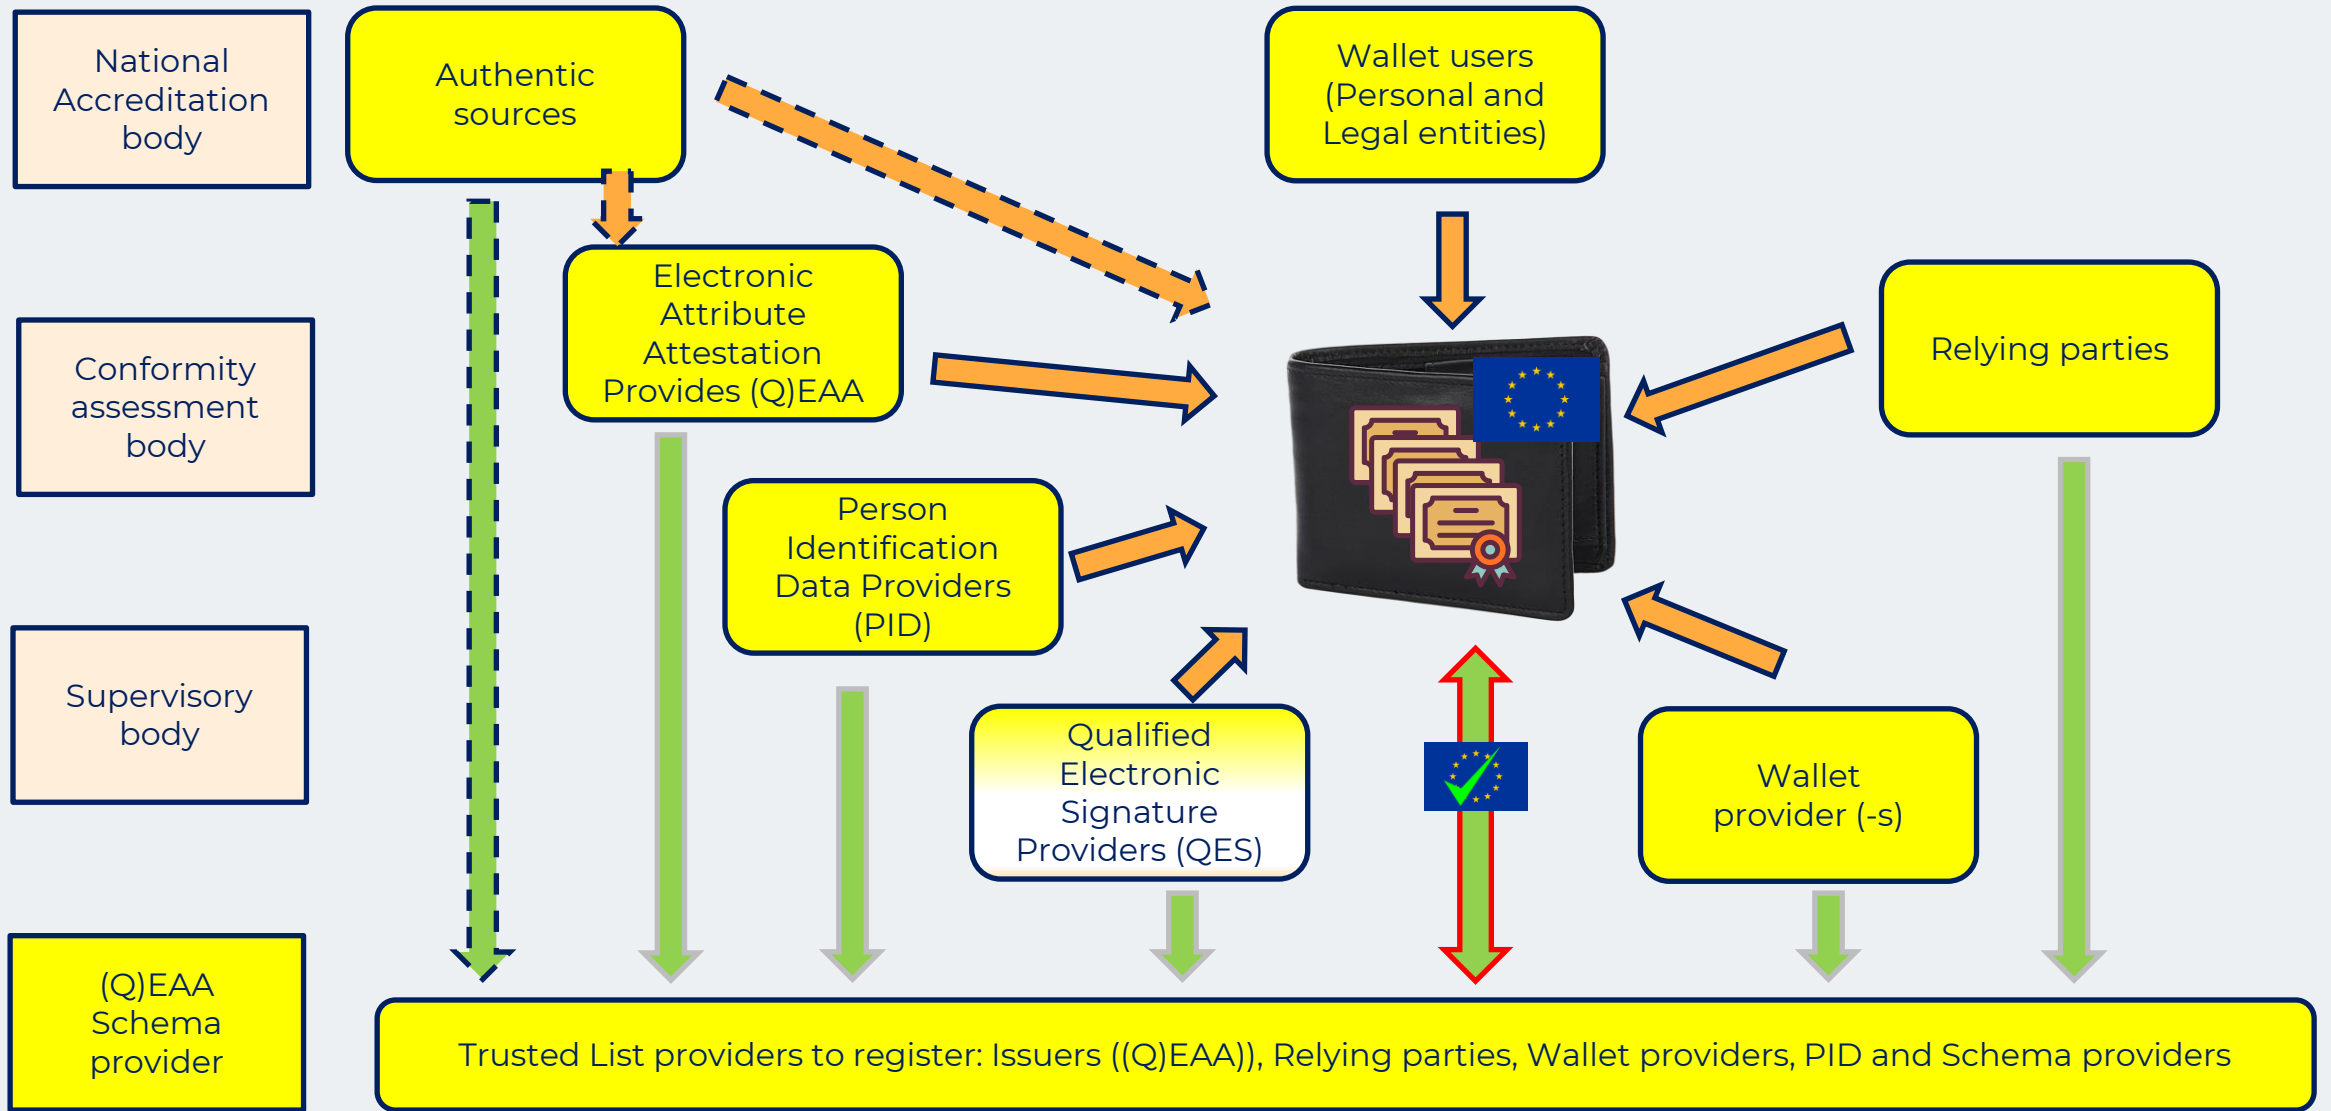

According to McKinsey, countries that implement a successful digital ID could unlock value equivalent to 3 to 13 percent of GDP by 2030

<https://www.mckinsey.com/industries/financial-services/our-insights/banking-matters/digital-id-the-opportunities-and-the-risks>

The European Identity framework, or the Wallet, is not just a goal but a **means** to achieve many important objectives.

\* - Unfortunately, I do not know who is the author of this statement

# eIDAS 2 will create a new ecosystem with a lot of new roles

# How this new ecosystem could (will ! :) unlock such big value?

- **Government services** – Issue and accept digital “documents” in a new way (data)
- **Digital supply chain** – No paper, 100% data verification for customs, and tax authorities
- **Cybersecurity** – No passwords, no usernames, no logins, no phishing, no fraud risks
- **Smart cities** – No 100s of apps to develop
- **Healthcare** – Simple remote identification, etc
- **Payments** – Services integrated with banks, etc (banks, firms, etc.)
- **KYC/AML** – Much cheaper
- **Mobility** – Digital documents, by user
- **IoT** – The same “app” to interact with things, good on your behalf

Legal means approved  
by the government  
in a ~500 million  
citizens market  
(from May 2024)

And many other use cases

- **AI** - reduce risks related to AI
- **Web3** - Create native digital assets, including MiCA related
- **Metaverse** – Metaverse without proper digital ID
- **Digital assets** – Will create a “bridge” between real and virtual worlds

**But... ;-)**

Lithuania has a lot of good digital services; however, from an eIDAS 2 point of view, most of them will become “outdated”.

First, we need to create eIDAS 2 related means (ecosystem):

The European Identity framework, or the Wallet, is not just a goal but a **means** to achieve many important objectives.

Then, we will have the possibility to unlock such big value (Lietuvos galimybės!):

According to McKinsey, countries that implement a successful digital ID could unlock value equivalent to 3 to 13 percent of GDP by 2030
